

# EDUCATION ic not the learning of facts, but the training of the mind to think.

Albert Einstein

When you wish good for others, good things come back to you.
This is the LAW OF NATURE.

### WARM WELCOME

- A WARM WELCOME TO ALL THE STUDENTS IN ONLINE CLASSES. THIS IS D.CHARLES TEACHER SENIOR SECTION (BOYS).WE ARE GOING TO START OUR ONLINE GENERAL CLASS TODAY.
- I HOPE YOU WILL LEARN AND ENJOY.
- RULES OF THE CLASS ROOM:1)BE ON TIME FOR ALL YOUR CLASSES.2)RESPECT ALL PARTICIPANTS OF THE CLASS.3)DO NOT CREATE ANY DISTURBANCES .4) RAISE YOUR HAND IF YOU HAVE ANY QUESTION.5)GIVE RESPECT TO YOUR TEACHER.

# POINTS TO PONDER:

### LESSON OBJECTIVE:

- BY THE END OF THIS PART OF LESSON, STUDENTS BE ABLE TO:
- DERIVE SELF-IONIZATION OF WATER.
- DEFINE pH ?WHAT IS THE IMPORTANCE OF Kw?
- WHAT IS pHscale? Write its importance?
- Define indicators? why they are used?
- Define salts? How they formed?
- What is meant by neutralization?

### CHARACTERISTICS:

### Characteristics of Acids & Bases

#### Acids

- \*Produce H<sub>2</sub>O\*1 (hydronium ion) in water
- ·Tastes sour
- May sting or burn on contact
- React with active metals to form hydrogen gas
- Turn blue Itmus paper pink

#### Bases

- Produce OH\*1 (hydroxide ion) in water
- · Tastes Bitter
- Feels stippery
- ·Tums pink litmus paper blue

# Properties of Acids and Bases

ACIDS	BASES	
taste sour	taste bitter	
do not feel slippery	feel slippery	
pH < 7	pH > 7	
release hydrogen (H*) ions in aqueous solution	release hydroxide (OH·) ions in aqueous solution	
corrode metals	do not corrode metals.	
react with metals to produce a compound and hydrogen gas	do not react with metals to produce a compound and hydrogen gas	
turn litmus red/pink	turn litmus blue	

### Acidic/Basic Characteristics

### Acids

- Tend to have a tangy or sour taste
- A substance that produces hydrogen ions in solution, H<sup>+</sup> (aq)
- Actually produces a hydronium ion , H<sub>3</sub>O+ but the H+ is used to simply the reaction equation.

### Bases

- Tend to have a bitter taste and a slippery feel
- Term alkali used for base that is soluble in water with the solution said to be alkaline.
- A substance that produces hydroxide ions in solution, OH: (aq)

### Arrhenius Definition of

 Acids - Substances that produce hydrogen ions, H+ when dissolved in water

 Bases - Substances that produce hydroxide ions, OH<sup>-</sup> when dissolved in water

NaOH → Na+ + OH-

## **Arrhenius theory of bases**

- Arrhenius defined a base as:
   A substance that dissociates in water to produce OH<sup>-</sup> ions.
- For example: when NaOH is added to water:

In general:

$$XOH \longrightarrow X^{+} + OH^{-}$$

# The Arrhenius Theory of Acids and Bases

- Acids are substances which produce hydrogen ions H<sup>+</sup>, in solution.
- Bases are substances which produce hydroxide ions OHin solution.
- Neutralization happens because hydrogen ions and hydroxide ions react to produce water.

### Arrhenius Acids & Bases

- Arrhenius Acids
  - □ Donate H\* to the solution
- □ HNO<sub>3</sub> → H+ + NO<sub>3</sub>

- □ Arrhenius Bases
  - Donate OH to the solution
- □ NaOH → Na+ + OH

### Common Acids

<b>Chemical Name</b>	Formula	Uses	Strength
Nitric Acid	$HNO_3$	explosive, fertilizer, dye, glue	Strong
Sulfuric Acid	H <sub>2</sub> SO <sub>4</sub>	explosive, fertilizer, dye, glue, batteries	Strong
Hydrochloric Acid	HCl	metal cleaning, food prep, ore refining, stomach acid	Strong
Phosphoric Acid	H <sub>3</sub> PO <sub>4</sub>	fertilizer, plastics & rubber, food preservation	Moderate
Acetic Acid	HC <sub>2</sub> H <sub>3</sub> O <sub>2</sub>	plastics & rubber, food preservation, Vinegar	Weak
Hydrofluoric Acid	HF	metal cleaning, glass etching	Weak
Carbonic Acid	$H_2CO_3$	soda water	Weak
Boric Acid	$H_3BO_3$	eye wash	Weak

Name, Formula	Use	Other Information
Acetic Acid	Food Prep and Preservation	When in solution with water it is known as vinegar
Acetylsalicyclic Acid	Pain Reliever, Fever reducer	Known as aspirin
Ascorbic Acid	Antioxidant, Vitamin	Called Vitamin C
Carbonic Acid	Carbonated Drinks	Involved in cave, stalactite, and stalagmite formation and acid rain
Hydrochloric Acid	Digestion as gastric juice	Commonly called Mariatic Acid
Phosphoric Acid	Makes detergents, fertilizers, and soft drinks	Sour but pleasant taste, detergents containing phosphates polute water
Sulfuric Acid	Car batteries, fertilizers	Dehydrating agent, causes burns by removing water from cells
Nitric Acid	Makes fertilizers	Colorless, but yellow when exposed to light

### **Common Acids**

### Common Bases and Some Everyday Uses Table 13.2

Name	Formula	Uses
Sodium	NaOH	Used in drain and oven cleaners
Hydroxide		and soap making.
(Caustic Soda)		\$250 EST
Ammonia	NH <sub>3</sub>	Household cleaners, fertilizers and
		explosives.
Calcium	Ca(OH) <sub>2</sub>	Found in cement and mortar and in
Hydroxide	20	garden lime to adjust soil pH.
Magnesium	$Mg(OH)_2$	Key ingredient in some antacids.
Hydroxide		
Sodium	Na <sub>2</sub> CO <sub>3</sub>	Used in manufacture of washing
Carbonate	2000- 2000	powder and glass.

# **Table 2** Examples of some common bases

Common Name	Formula	Source or use
Sodium hydroxide	NaOH	Drain cleaner
Potassium hydroxide	КОН	Soap, cosmetics
Aluminum hydroxide	Al(OH) <sub>3</sub>	Antacids
Ammonium hydroxide	NH <sub>4</sub> OH	Window cleaner.

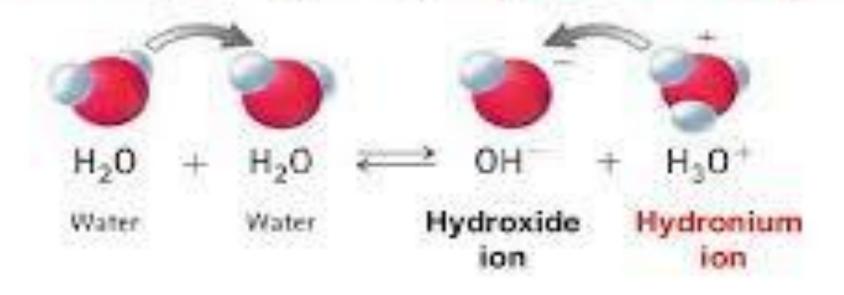

# POINTS TO PONDER:

$$2H_2O \qquad H_3O^+ \qquad OH^-$$

$$+ \bigcirc \longrightarrow \bigcirc + \bigcirc$$

A water molecule that loses a hydrogen ion becomes a negatively charged hydroxide ion OH-

A water molecule that gains a hydrogen ion becomes a positively charged hydronium ionH<sub>3</sub>O\*

Self ionization of water – the reaction in which water molecules produce ions.

### Self-ionization of water

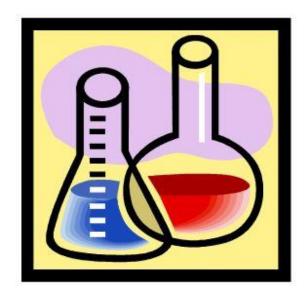

The self-ionization of water (also autoionization of water, and autodissociation of water) is an ionization reaction in pure water or an aqueous solution.

$$2H_2O \qquad H_3O^+ OH^-$$

$$+ \bigcirc \longrightarrow \bigcirc + \bigcirc$$

### Self-Ionization of Water

- Two water molecules produce a hydronium ion & a hydroxide ion by the transfer of a proton.
- $H_2O(I) + H_2O(I) \rightarrow H_3O^+(aq) + OH^-(aq)$
- In pure water, every time you make one H<sub>3</sub>O<sup>+</sup> you get one OH<sup>-</sup>
- That is,  $[H_3O^+] = [OH^-]$

# SELF-IONIZATION/Kw:

### Self-Ionization Of Water

Even the purest of water conducts electricity. This
is due to the fact that water self-ionizes, that is, it
creates a small amount of H<sub>3</sub>O<sup>+</sup> and OH<sup>-</sup>.

$$H_2O + H_2O \square H_3O^+ + OH^-$$
  
 $K_w = [H_3O^+][OH^-]$ 

- K<sub>w</sub> ion product of water
   K<sub>w</sub> = 1.0 x 10<sup>-14</sup> at 25 °C
- This equilibrium constant is very important because it applies to all aqueous solutions - acids, bases, salts, and non-electrolytes - not just to pure water.

### POINTS TO PONDER:

KW CONSTANT

Kw

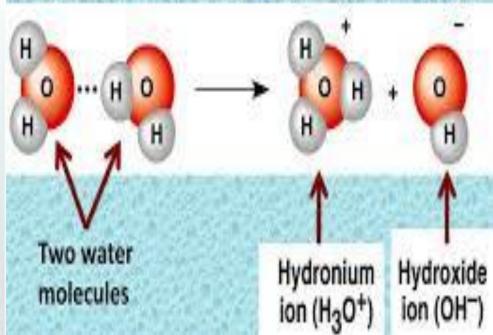

Self-ionization constant of water

 $Kw = [H_3O^+][OH^-]$ 

### **Ionization of Water**

- Water molecules have a tendency to "fall apart" or dissociate
- · "Dissociate" means to separate or disconnect from

### **Autoionization of Water**

The <u>auto-ionization</u> of water is described by the equation:

$$H_2O(I) + H_2O(I) \Rightarrow H_3O^+(aq) + OH^-(aq)$$

The equilibrium constant for this reaction is given by:

$$K = \frac{[H_3O^+][OH^-]}{[H_2O][H_2O]} = \frac{[H_3O^+][OH^-]}{[H_2O]^2}$$

$$K[H_2O]^2 = [H_3O^+][OH^-]$$

 $K_w = K[H_2O]^2 = 10^{-14}$  This <u>equilibrium</u> lies very much to the <u>left</u> i.e. mostly water. For <u>pure water</u> [OH-] =  $[H^+] = 1 \times 10^{-7} \text{ M}$ 

### Ionic Product of water, K<sub>w</sub>

$$H_2O_{(I)} \longrightarrow H^+_{(aq)} + OH^-_{(aq)}$$
 $K_c = [H^+][OH^-]$ 
 $[H_2O]$ 

Since [H<sub>2</sub>O] is effectively constant and in large excess

$$K_{w} = [H^{+}][OH^{-}] \text{ mol}^{2}dm^{-6}$$

### Ionic Product of water, K<sub>w</sub>

At 298K the value of K<sub>w</sub> is 1 x 10<sup>-14</sup> mol<sup>2</sup>dm<sup>-6</sup>

$$K_w = [H^+][OH^-] \text{ mol}^2 dm^{-6}$$

In pure water  $[H^*] = [OH^*]$ 

So  $K_w = [H^+]^2$  Hence  $[H^+] = \sqrt{K_w}$ 

At 298K [H+] =  $\sqrt{(1 \times 10^{-14})}$  = 1 x 10<sup>-7</sup>

So at 289K the pH of pure water is 7

### How is pH defined?

 The pH of a solution is the negative logarithm of the hydrogen-ion concentration. The pH may be represented mathematically, using the following equation:

$$pH = -log[H^+]$$

In pure water or a neutral solution,  $[H^+] = 1 \times 10^{-7} M$ , and the pH is 7.

pH = 
$$-\log(1 \times 10^{-7})$$
  
=  $-(\log 1 \times \log 10^{-7})$   
=  $-(0.0 + (-7.0))$   
= 7.0

If the [H+] of a solution is greater than 1 × 10<sup>-7</sup>M, the pH is less than 7.0.
 If the [H+] of the solution is less than 1 × 10<sup>-7</sup>M, the pH is greater than 7.0.

### Ph definition:

The definition of pH is the negative logarithm of the hydrogen ion (H+) activity in a given solution.

The range of the ph scale is from 0 to 14.

### pH

For 
$$H_2O_{(l)} \neq H^+_{(aq)} + OH^-_{(aq)}$$

$$\rightarrow$$
 [H<sup>+</sup>] = [OH<sup>-</sup>]

$$[H^+] \times [OH^-] = 1 \times 10^{-14} = [1 \times 10^{-7}] \times [1 \times 10^{-7}]$$

[H<sup>+</sup>] of water is at 25°C is 1 x 10<sup>-7</sup> mol/litre

Replacing [H<sup>+</sup>] with pH to indicate acidity of solutions

pH 7 replaces [H<sup>+</sup>] of 1 x 10<sup>-7</sup> mol/litre

where 
$$pH = -Log_{10}[H^+]$$

### IMPORTANCE OF Kw:

### The Importance of K<sub>w</sub>

 It is important to recognize the meaning of Kw. In any aqueous solution at 25°C, no matter what the solution contains...

```
the product of [H^+(aq)] and [OH^-(aq)]
must always equal 1.0 x 10^{-14}
```

- There are three possible situations:
  - In a NEUTRAL solution [H<sub>+</sub>] = [OH<sub>-</sub>]
  - 2. In an ACIDIC solution [H<sub>+</sub>] > [OH<sub>-</sub>]
  - In a BASIC solution [H<sub>+</sub>] < [OH<sub>-</sub>]

In each case at 25°C,  $[H+(aq)][OH-(aq)] = 1.0 \times 10^{-14}$ 

### POINT TO PONDER:

Bleach Soapy water Ammonia solution Milk of magnesia Baking soda Sea water Distilled water Urine Black coffee Tomato juice Orange juice Lemon juice Gastric acid

#### Home remedies for Acidity / Heartburn

### Which Foods Are Acidic?

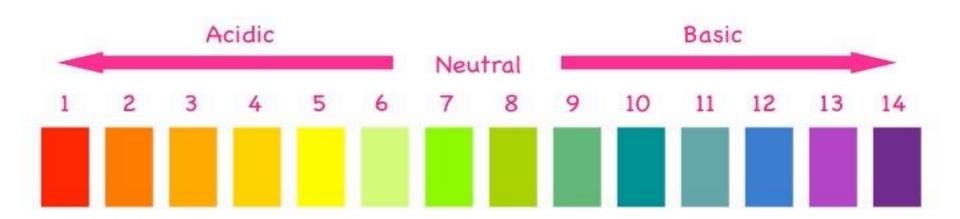

ePainAssist.com

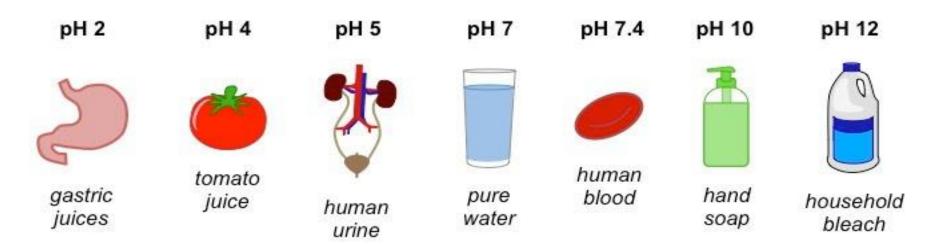

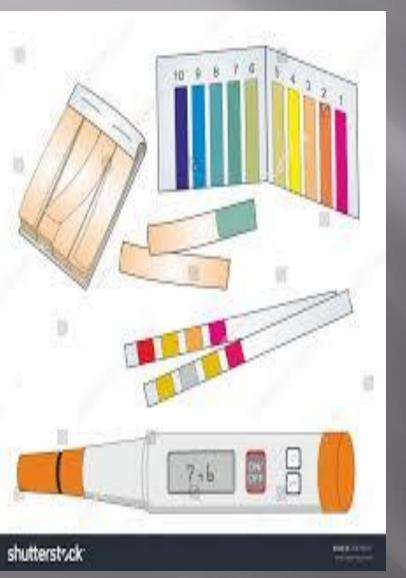

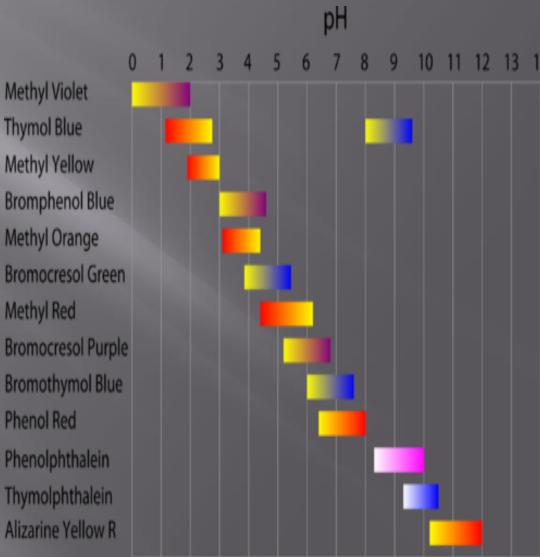

#### Examples of pH Conditions:

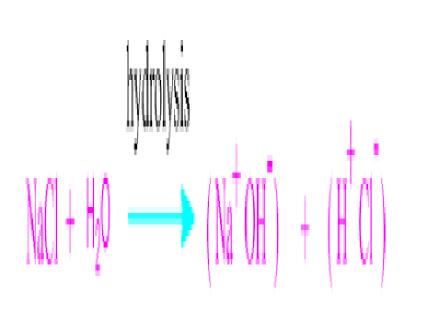

## Acids, Bases, and Salts

#### **Neutralization Reaction**

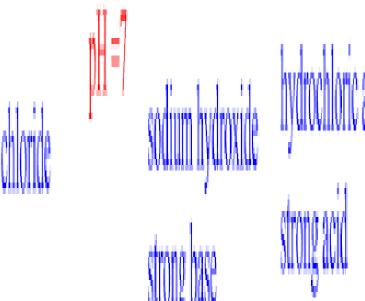

$$HCl(aq) + NaOH(aq) \rightarrow H_2O(l) + NaCl(aq)$$

#### **Total Ionic Equation**

$$H^{+}(aq) + Cl^{-}(aq) + Na^{+}(aq) + OH^{-}(aq) \rightarrow H_{2}O(l) + Na^{+}(aq) + Cl^{-}(aq)$$

**Net Ionic Equation** 

$$H^+(aq) + OH^-(aq) \rightarrow H_2O(l)$$

Chapter 5 35

### Acids, Bases and Salts

#### **Examples of Salts**

#### Table 1

Base (alkali)	Acid	Salt formed
Sodium hydroxide	Hydrochloric acid	Sodium chloride
Potassium hydroxide	Hydrochloric acid	Potassium chloride
Sodium hydroxide	Sulphuric acid	Sodium sulphate
Potassium hydroxide	Sulphuric acid	Potassium sulphate
Calcium hydroxide	Nitric acid	Calcium nitrate
Ammonia solution	Nitric acid	Ammonium nitrate

### SALTS:

### What type of reaction? $HCI + NaOH \rightarrow H_2O + NaCI$

- A neutralization reaction is the reaction between an acid and a base to produce a salt plus water.
- A salt is any compound containing the cation of a base and an anion from an acid.
  - NaOH (base) -- Na+ cation
  - HCL (acid) -- Cl- anion
  - SALT -- NaCl

#### 1) SODIUM CHLORIDE NaCI

In solution strong base and strong acid are dissociated completely. The salt solution is neutral. **No hydrolysis.** 

#### **Making salts**

The salt produced by a neutralization reaction depends on the acid and the alkali used.

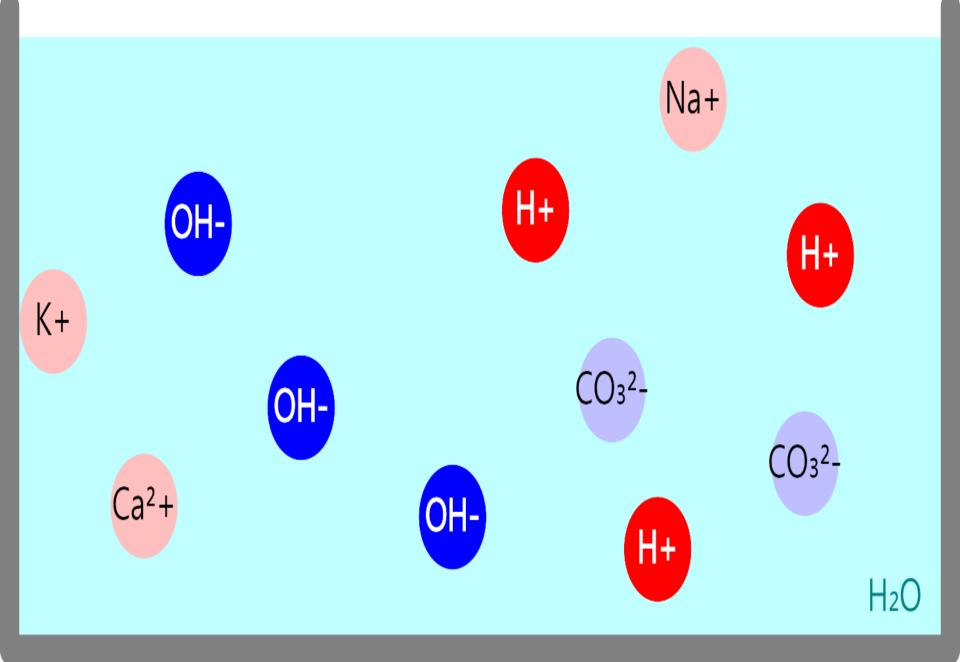

Sodium chloride is produced by the reaction between hydrochloric acid and sodium hydroxide.

Which acid and which alkali would be needed to make the salt potassium chloride?

```
hydrochloric + potassium hydroxide + potassium chloride + water
```

### Neutralization

During a neutralization reaction, an acid and a base react to produce a salt and water. Salts are ionic compounds consisting of an anion from an acid and a cation from a base.

$$HCl_{(aq)} + NaOH_{(aq)} \rightarrow NaCl_{(aq)} + H_2O_{(l)}$$

$$H_2SO_{4(aq)} + 2NaOH_{(aq)} \rightarrow Na_2SO_{4(aq)} + 2H_2O_{(l)}$$

$$2HCl_{(aq)} + Ca(OH)_{2(aq)} \rightarrow CaCl_{2(aq)} + 2H_2O_{(l)}$$

### Neutralization

#### Acid-Base Neutralization

H<sup>+</sup><sub>(aq)</sub> + OH<sub>(aq)</sub> 
$$\Longrightarrow$$
 H<sub>2</sub>O<sub>(i)</sub> + 13 Kcal/mol

Strength of Acids, the Equilibrium Constant:

$$HA \implies H^{+}_{(aq)} + A^{-}_{(aq)} \quad K = \frac{[H^{+}][A^{-}]}{[HA]}$$

A large K means a strong acid. It's highly ionized.

A Salt is a compound derived from the reaction of an acid plus a base. Or from ions from opposite sides of the periodic chart.

### SELF-ASSESSMENT 10.5:

- $Mg(OH)2 + HCl \rightarrow MgCl2 + H2O$
- KOH + HCl  $\rightarrow$  KCl +H2O
- BALANCE THE FOLLOWING NEUTRALIZATION REACTIONS:(i)H2SO4 +NaOH→Na2SO4 + H2O
- (ii)H3PO4 +NaOH→Na3PO4 + H2O
- SELF ASSESSMENT 10.6:
- CLASSIFY THE FOLLOWING SALTS AS NORMAL OR ACID SALT
- NaHCO3,NaHSO4,Na2SO4,KHCO3,K2CO3.

# Today's Learning

Something I can do now that I couldn't do before the lesson is...

A question I would like to know the answer to is...

I need to improve on.

### **HOME-WORK:**

- Homework:
- DO ANY ONE QUESTION:
- EXPLAIN SELF-IONIZATION OF WATER?
- DERIVE THE KW OF WATER?
- WHAT IS pH ?WRITE THE IMPORTANCE OF Kw?
- EXPLAIN pHscale?
- **DEFINE SALT?HOW IT IS PREPARED?**
- DEFINE NEUTRALIZATION?

## CLOSURE OF THE LESSON:
