Kingdom of Bahrain

CLASS : 10

SUBJECT : PHYSICS

ENGAGING STARTER

- Describe the name of some properties that are studied by using ripple tank.

TOPIC

1. Diffraction

OBJECTIVE

- At the end of this lesson students will be able to :
- Analyze the properties of waves.
(Diffraction)

DIFFRACTION

- ◉ The bending or spreading of wave around the sharp edges or corners of obstacles is called diffraction.

Large Opening

Small Opening

WORKING

- On setting the vibrator ON, this wooden plate starts vibrating to generate plane water waves.
- An electric bulb is hung above the tray to observe the image of water waves on the paper or screen.
- The crests and troughs of the waves appear as

EXPLANATION

- After generating plane wave in ripple tank , place two obstacles in line in such a way that separation between them is equal to the wavelength of water waves .

TO STUDY DIFFRACTION

- To this observation of diffraction of water waves, when separation between slit is equal to wavelength . The waves after passing the slit will spread in every direction and change into almost semicircular pattern .

- When separation between the obstacle is larger than wavelength of wave . In this case only a small diffraction occurs near the corners of the obstacle.

CONCLUSION

Reminder: What is Diffraction?

- Bending and spreading of a wave into a region behind an obstruction
- Examples: waves passing through openings or around corners
- Effects depend on how wide the opening is relative to wave length
 - Wide opening: little wave spreading
 - Narrow opening: wave fans out, changes shape
 - (Wide: opening $>$ wave length;
 - Narrow: opening \sim wavelength

DIFFRACTION (WITH SMALL SEPARATION BETWEEN OBSTACLES)

DIFFRACTION (WITH LARGE SEPARATION BETWEEN OBSTACLES)

- What is the wavelength of the radio waves transmitted by an FM station at 90M Hz and speed of radio waves is 300000000 m/s.

Given

Frequency = $f =$

Speed = $v =$

To find

Wavelength = $\lambda =$?

Solution

Using wave equation

$V = \dots \lambda$

$\lambda = \dots / \dots$

$\lambda = \dots \text{m}$

PLENARY

- To study diffraction we have to put twoin the path of water waves.
- The bending of waves around the corners of obstacles is known as ...(reflection / diffraction)
- If the separation between the obstacles is equal to the wave length of water waves then Pattern is formed.
- Diffraction is done only in water waves.
T/ F

HOME WORK

- Search and write some daily life applications of diffraction .
- Light waves or
- water waves .
